This offer cannot be combined with other promotions, not even previous purchases. How to order: At Epson. . The active networked Epson printing system enables you to print even from a computer in the future without owning a printer. The system can easily be set up on different network environments. The printing system is suitable for individual use and for small office networks. Paper copy media, such as documents or photos, is printed and scanned directly on the monitor. The advanced office system P-785W uses Canon's Multifunction Printing (MFP) technology, a complete, self-contained printing system that combines scanner, copier, and printer into a single device. This makes using the P-785W more efficient and allows for easier network integration with other systems in your office. Features include a multifunction auto document feeder, print speed of up to 22 pages per minute, duplex scanning, 2-in-1 technology, front- and rear-side scanning, document compression, and automatic document feeder with power-saving mode. The inkjet MFP printer is designed for easy connectivity and use, as well as superb print and copy quality. Enjoy crisp text and vivid, borderless photo printing, straight from your iPhone, iPad, or Mac. . Learn about

The Canon printer can handle eight ppm (pages per minute) for black and white printing and 30 ppm for color printing, while the HP printer can handle only two ppm for black and white printing. To view your print job on the job monitor, you can choose from either direct or USB. To choose between these two types of connection, you have to download the application called "miniprint" from the Canon website. The advantage of using USB printing is that you can print from a variety of devices, including a smartphone, tablet and laptop computer. Wi-Fi printing connects to your printer wirelessly using a USB port. It's easy to set up, and once you do, you can print directly from your smartphone, tablet and laptop computer—no computer is required. Printer resolution refers to the number of dots that appear on the page. For a printer with 600 dots per inch, you need to print at 600 dots per inch or better to get a clear print. Most inkjet printers have a resolution of 300 to 600 dots per inch. Resolution should be considered on a per-page basis. If the printer is rated at 300 dots per inch, but a 300-dpi print looks like a 72-dpi print, you're not seeing the true resolution of the printer. For example, if you're printing a photo from a camera at 300 dpi and the print looks sharp, it's really a 72-dpi print. The 300-dpi photo was enlarged to fill the 72-dpi paper. This may not be obvious when looking at the print. For true 300-dpi prints, you need a printer with 300 or better dots per inch. You can also experiment with a higher-resolution printer. For example, the Canon Pixma iP3650 is a 600-dpi printer, so you can print at 600 dots per inch and get a sharp print. You can print a document at the actual resolution of the printer. For example, if your printer is rated at 300 dpi, you can print at 300 dpi, resulting in a sharp print. Just like with other printers, you can also print at a lower resolution if you want. For example, if you want to print a document at 100 dpi, you can simply increase the print quality on your print software
