Category:3D computer graphics software for Linux Category:3D animation software for Linux Category:Film and video technology Category:Animation software Category:Rendering software for Linux Category:Rendering software for MacOS Category:Rendering software for WindowsThe present invention relates to an improved arrangement for improving the limit of latchability of a locking mechanism for a folding table. More particularly, the present invention relates to an improved arrangement for allowing a central latch to be capable of being latched from either side. It is known to provide a table having a locking mechanism for locking the table in an opened or a closed position. For instance, there are folding tables that provide a folding table which is fixed in its first (or uppermost) position and that is capable of being moved to its second (or lowermost) position. In order to move the folding table to its second position, the locking mechanism is released so that the table can be moved between the first and second positions. Typically, a locking mechanism includes a central latch and two latches each on one side of the central latch. The central latch is located in a slot of a table body and the two latches on either side of the central latch are located in a stop that is formed on either side of the table body. When the folding table is opened or closed, each latch mates with a stop such that the table body cannot rotate too far and that the table body does not slide too far to either side. When the folding table is fully opened, the central latch engages with a portion of the stop. Such a latch mechanism is known as a central latch. While such a latch mechanism is desirable in the prior art, one disadvantage is that if one of the two latches on either side of the central latch is able to be released, the central latch is still held. In such an arrangement, the central latch may be inadvertently released when the folding table is in the first position. Such inadvertent release causes the folding table to be inadvertently moved to the second position such that the table may fail to latch in the second position. Thus, the folding table may cause damage or destruction to another object. Therefore, there exists a need for an improved folding table having a locking mechanism with a more reliable locking mechanism. Particularly, there exists a need for a locking mechanism that prevents inadvertent release of the central latch when the table is in its first position. Further, there exists a need for a locking mechanism that is capable of being ba244e880a
