If you'd like to keep this widget on your own blog, you can copy the code below, and then when you go to the widget screen of your blog, click on 'copy code' and then go to the widget screen and paste the code. About Me I am a recent graduate of the University of Memphis School of Journalism. I am a proud member of the Kappa Kappa Gamma sorority and the SGA. In the past, I have worked at the Memphis Commercial Appeal, WDAM-AM/1150, and the Memphis Chapter of the Society of Professional Journalists. I will be graduating with a degree in mass communications and a minor in english in December.This new research paper explores the history of the media industry. I had no idea there were so many news organizations in the U.S. when I wrote about the future of news in 2009. If you're at all familiar with news content, you probably remember news stories from a very specific time period. Then, it was the New York Times. Then, it was CNN. Then, it was FOX News. Now, we have a slew of news orgs that are mostly known for their news coverage from a particular area of the country. This is mostly good, because it means we have options when it comes to news coverage. If you want national coverage, you go to CNN. But if you

The protection against influenza is improved by a sequential vaccination approach of seasonal influenza vaccines with respect to T-cell-dependent antibody responses. In elderly people (age 65 years and older) who received a single dose of an intranasal live attenuated influenza virus vaccine for priming followed by a subcutaneous vaccine containing a non-adjuvanted split inactivated influenza virus vaccine, the haemagglutination inhibition antibody titres were significantly higher and immune cell numbers (CD4, CD8 and NK cells) were significantly lower in the sequential vaccination group compared with the simultaneous vaccination group. We hypothesise that the induction of a cross-reactive immune response with a sequential approach could be of therapeutic benefit. In this study, we examine the effectiveness of a sequential vaccination in elderly people to prevent an influenza virus challenge. We enrolled 120 elderly people (age 65 years and older), half of whom were primed with a live attenuated intranasal influenza virus vaccine and half with a subcutaneous influenza vaccine containing a non-adjuvanted split influenza virus vaccine. Half of both groups were challenged with the same strain of influenza virus as the vaccine. Three weeks after the challenge with the seasonal influenza virus, we measured the haemagglutination inhibition antibody titres. Six months after the challenge, we measured the antibody titres and the cell-mediated immunity (cytotoxicity, cytokine production and IFN- γ production). We compared the number of subjects who were protected (measured by haemagglutination inhibition antibody titres of 40 or more) and the number of subjects who were infected with the same virus strain. The median haemagglutination inhibition antibody titres were significantly higher in the sequential vaccination group than in the 2d92ce491b
