"En caso de.Q: In the original 'On the Origin of Species' can you make a claim that "Mankind is descended from Common Chimpanzees"? In the book 'On the Origin of Species', Darwin mentions that "Mankind is descended from Common Chimpanzees". My question is, can you make a claim that "Mankind is descended from Common Chimpanzees"? Or is it a claim that is excluded from this book of Origin? A: This statement is not contained in the book. The first edition of the book states: 1859 On the origin of the species by means of natural selection, or the preservation of favoured races in the struggle for life. The next edition, however, was only published in 1871, ten years after the statement was made: 1870 On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life. Now the book doesn't give a specific date for the statement, but judging from the context it's safe to assume that Darwin, Huxley, and the French naturalist Alfred Russel Wallace were all in agreement on that one (whether or not they actually all wrote these words is a different matter of course). The first edition and the second edition are both listed under the same title, so we can pretty much assume that they're both from the same year. Furthermore, the statement has long been removed from later editions of the book, e.g.: 1958 On the Origin of Species by Means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life. It's not clear to me what "the origin of the species by means of natural selection, or the preservation of favoured races in the struggle for life" means. I guess that it was in reference to the idea that different groups in nature (e.g. plants and animals, or man and animals) had some special characteristics that distinguished them from other groups in the same species 2d92ce491b
