I understand that nice is used to give priority to one or more processes over other ones, and it is not installed by default in Ubuntu. However, I also read that the command nice is installed by default. Why "nice" is a command? I understand that it is given priority to some task, but what is the default task it gives priority? A: nice is a built-in program, which means it's part of the GNU project and is installed by default. From help nice: NAME nice - set priority for a process SYNOPSIS nice [OPTION]... [PROGRAM]... [COMMAND]... [ARG]... DESCRIPTION The nice(1) utility sets the priority of a process to the specified value (between 0 and 199). The default priority is 0. Nice affects only those processes run by the invoking user. So it doesn't do anything by default, it only sets priority to your current process. That is why it's not installed by default in Ubuntu. A: You are probably referring to the "nice" command which is the "set priority" command. The nice utility sets the priority of a process to the specified value (between 0 and 199). The default priority is 0. Nice affects only those processes run by the invoking user. Why "nice" is a command? Because it's built-in 2d92ce491b
