Determination of kidney function in patients with atopic dermatitis using [(99m)Tc]dimercaptosuccinic acid and dynamic renal scintigraphy. Although a significant number of patients with atopic dermatitis (AD) are known to have a tendency toward decreased renal function, the blood clearance of [(99m)Tc]dimercaptosuccinic acid (DMSA) in these patients has not yet been clarified. In the present study, the blood clearance of [(99m)Tc]DMSA was investigated in patients with AD. The activity of [(99m)Tc]DMSA administered intravenously was calculated from dynamic imaging studies. Furosemide was given intravenously to examine the relation between the blood clearance and the plasma clearance of furosemide. The blood clearance of [(99m)Tc]DMSA in patients with AD was significantly decreased as compared with that in a healthy control group. In AD patients, the blood clearance of [(99m)Tc]DMSA correlated significantly with the clearance of furosemide (the mean values were 0.68%/min in the AD group and 1.31%/min in the control group). However, in AD patients, these two parameters were not correlated in regard to the extent of the affected area.
