is the default Windows and Mac text editor used for editing the internal text records in the DWG files. JavaScript vs Java vs C++ Is it true that all these are used for languages? JavaScript is a language (the whole platform and language). Java is a platform, which uses a different language to run than the language used to create it. C++ is a platform, which uses a different language to run than the language used to create it. I'm sorry if this is a silly question, I'm just trying to understand how all these languages are used. A: C++ and JavaScript are both scripting languages, and Java is a general-purpose, compiled language. A scripting language is a language that can be compiled for the platform that it's running on, but not necessarily by the platform itself. JavaScript, for instance, is a script for browsers, but it's not generally compiled by a browser. C++ is a scripting language for the (standard) compiler for C++, and so when you compile C++, you get an executable. A general-purpose, compiled language is a language that is designed to be compiled for multiple purposes, usually in an automated fashion. Java is one such language, which was originally designed a1d647c40b
