It is well known in the art to effect foaming of a sprayable composition by the use of an extrusion/spray system and an intermittent supply of pressure. See, for example, U.S. Pat. No. 3,928,485 and U.S. Pat. No. 4,072,614. Sprayable compositions, such as polyisocyanates, in particular, can suffer from an undesirable build-up of foam on the chamber walls of the extruder and, in addition, a reduced throughput of material because of foaming. This can lead to poor control over the metering or spray characteristics of the composition.Pentadebutylamine Pentadebutylamine is an organic compound with the formula $C_{15}H_{33}N$. It is a colorless liquid that is widely used as a high-boiling solvent. It is related to and often confused with heptadebutylamine, which has the formula $C_{17}H_{35}N$. The compound has many uses in industry, and is notable as the precursor to the benzimidazole and triazole heterocycles. It can be prepared by the addition of an alkali metal salt of cyanide to pentadecane.
