particular, to a charge and release sealing technique for a large-capacity lithium-ion secondary battery. As the problem of global warming due to the environmental destruction and the energy crisis that has accompanied rapid development of the modern society is increasingly severe, the importance of electrical storage devices having high energy density and long cycle lifetime is increasing. Lithium-ion secondary batteries, which are compact and lightweight, and have high capacity and high energy density, are recently attracting attention as next-generation energy storage devices, and are expected to be used in wide fields such as electric vehicles and large mobile devices. In recent years, a problem of dendrite growth in a nonaqueous electrolyte solution in lithium-ion secondary batteries has also been considered in terms of safety. The dendrite growth of lithium refers to the crystal growth of lithium from a lithium compound into metal lithium. In the case where the dendrite grows, the battery may easily ignite due to short circuit between a positive electrode and a negative electrode. To avoid such a risk, a countermeasure method is required, in which a sealing material for sealing the battery is used and is impregnated with a nonaqueous electrolyte solution that is to be poured into the battery. For example, as an example of a sealing material for sealing a cell in a cell, the cell is charged and discharged through an outlet portion that is sealed by a separator, and then lithium is deposited on an inner surface of the outlet
