Get it here in best quality and easy access. Q: What is the difference between sharing configurable properties between components and scoped styles? In the quest to get my styles to play nice together, what is the difference between the following: First approach: I configure a global style with one of my own components that I've created (BaseComponent). The BaseComponent has a configurable property (backgroundColor). Second approach: I create a component (TopComponent) that uses the configurable property in the BaseComponent. Then in TopComponent.styles and TopComponent.metaClasses I define an inline style or define a scoped style based on configurable property in the BaseComponent. I've worked on and off with Java for the last 3 months, so I'm doing this with C#. I'm sure there is no real difference between the two approaches, but I would like to know why they don't work the same? Thanks in advance. First approach Here's the configurable property: public class BaseComponent extends org.slf4j.LoggerFactory { private static final long serialVersionUID = 1L; public static final String

---

```
COLOR_PROPERTY = "configurableProp"; @Override public String  
getName() { return "BaseComponent"; } @Override public String  
getLoggerName() { return "BaseComponent"; } @Override public  
void begin() { System.out.
```
