A: Actually you want the MD5 checksum for the file. For that you should look at the first few bytes of the file. Since a torrent file is normally loaded from a file system to memory the bytes there are the checksum and not those at the head of the file. The MD5 you see in the beginning of the file is the checksum. If the first few bytes of a new file say be 5 bytes in length you get a checksum 5 bytes long like: MD5 algorithm of choice Hex value of the checksum The algorithm is usually just a number but may be someting like md5 or sha1. If you expect a long checksum, look at the first few bytes to see how much is in the file. Q: Return the value from a function I have a log function that returns the log value of the two parameters: log(base, exponent){ return Math.log(base, exponent); } However, I want to return the value of the log function rather than output the log values to my console. I know that the log values should be in a separate function, which is where my question lies. I know how to return the value from the function, but I am unsure how to return the value within the log function since it already returns the log value. i.e., This is what I am trying to achieve log(base, exponent){ return Math.log(base, exponent); } // how do I return the log value here? console.log(log(2, 2)); // outputs '1.4429..' I tried looking at some sources to try and understand how to return the value from a function, but I was not able to find any examples. A: If you want to return only the logarithm as a function, you'll have to return it as a proper function rather than a primitive. Function function log(base, exponent){ return Math.log(base, exponent); } log(2, 2); Closures function log(base, exponent){ var result = Math.log(base, exponent); return function(){ return result; } } log(2, 2)(); Alternatively, you

A: You can use String.Split to split ".[1] 4, 5, 6, [2] 7, 8, 9, [1] 10", and store the second element after each slash. var temp = s.Split("][1] 4, 5, 6, [2] 7, 8, 9, [1] 10"); var parts = temp.Where(x => x.StartsWith("[1]")).Select(p => p.Split(';')[1]).ToArray(); var index = 0; var found = 0; for (var i = 0; i ().Select(match => match.Value).ToArray(); /* * Copyright

The US telecoms giant said in an announcement published on the company's support web site that the "Prox", as the modems will likely be called, will not be capable of working with older devices. "iPhone 5s and later support the best, fastest, and most advanced 4G LTE network in the world," Apple wrote in the post. "And it's the only phone that can connect to multiple network types at once – so it seamlessly switches between all four of the best networks on the planet, including LTE, 4G, 3G, and 2G networks, so you can

experience the fastest possible
