Serious viral diseases are a significant cause of morbidity and mortality world wide. The use of intravenous immunoglobulin (IVIG) has been investigated in a number of viral infections and its mechanism of action is thought to be through immunomodulation, but the evidence is not convincing. The use of IVIG in the treatment of viral infections has been studied by meta-analysis, and trials of IVIG in patients with cytomegalovirus (CMV) infection and in influenza-associated encephalopathy have been reported. The results of trials are encouraging and suggest that IVIG has a role in the management of serious viral infections, although further larger, randomized, controlled studies are required to assess its efficacy and side-effects.Q: Корректна ли название метки?
